

Hydro Excavation

THE SAFEST WAY TO DIG WHEN YOU NEED TO KNOW THE SAFEST PLACE TO DIG

*Take it from anyone who's learned the hard way:
Underground / utility maps are not always up-to-date.*

Hydro excavation is the answer. It's a non-destructive process for using a controlled water flow to break up soil before it's vacuumed into a debris tank.

It's also an efficient, and cost-effective, solution for exposing foundation footers, pot-holing for utility pole installs, and slot trenching before installing new utilities — which is **CRITICAL** for avoiding expensive mistakes.

How expensive? The Common Ground Alliance reports that excavation-related utility damage cost about \$30 billion in 2019 alone.

Hydro Excavation

COMMON CUSTOMERS AND APPLICATIONS INCLUDE:

Construction Companies (Buildings, Pipelines).
Utility Companies. Manufacturers. Plumbers.
Commercial Irrigators, and more.

POT HOLDING / DAYLIGHTING

Need to identify a building footer, or know where the underground utilities, pipes and cables are located prior to excavation?

Pot holding exposes under-ground facilities and utility location, depth and type with accuracy.

REMOTE EXCAVATION

Narrow, impassable roads. Heavy wilderness. High traffic. No access for a backhoe.

Hydro excavation trucks allow you to dig in areas that traditional equipment has difficulty reaching.

SLOT TRENCHING

Need to dig a narrow trench without damaging buried utilities, not to mention the risk of accidents and injuries?

Slot Trenching allows you to dig thin, accurate trenches that minimize the amount of backfill.

PILING HOLE EXCAVATION

Need to install poles, posts, signs without excessive backfill?

Piling hole excavation allows you to dig faster, more accurately, and more cost effectively.
